

Create a ServiceNow foundation
and a more credible route
to AI value with SCC

About SCC

SCC, a privately owned technology provider, is fully committed to helping customers with operational and regulatory pressures break through the noise and achieve practical outcomes using ServiceNow.

SCC works to enhance systems that are already in play — recovering value from live, but underperforming, ServiceNow estates before venturing into new terrain. An SCC engagement starts with optimising ServiceNow platform health, whether that means fortifying data quality and the CMDB, crafting more robust integrations or instituting stronger governance policies. SCC's mission is to turn ServiceNow into a formidable backbone for service delivery, governance and workflow coordination — not just another ticketing platform for IT or other business function.

With a robust ServiceNow foundation in place, SCC consultants will work with clients to assess AI readiness, considering process maturity, trusted data, integration capabilities and clear governance guardrails. SCC, with UK headquarters and global offices, including in France and Spain, helps close the gaps using blueprints, accelerators and repeatable workflow patterns to reduce delivery risk and shorten time to value.

SCC helps clients zero in on the use cases where ServiceNow Now Assist, virtual agents and automated workflows can have the most business impact — such as accelerating case resolution, improving incident triage and facilitating seamless onboarding and smarter routing for high-volume service environments. This approach offers a more credible route to AI value, especially when speed, consistency and control matter as much as automation.

SCC's long-standing partnership with ServiceNow extends across the full portfolio with a special focus on ITSM, ITOM, ITAM, HRSD and App Engine, among other modules. SCC, winner of multiple ServiceNow partner awards, serves as a trusted partner across commercial strategy, delivery and ongoing operational support, helping shape the right service-management model and connect it to the broader operating environment.

Introduction: From Automation to Agency: The New Business Reality

Artificial intelligence (AI)

Fast-changing business climates are upending long-standing rules of engagement, putting companies at risk of getting left behind. With an enterprise wide digital platform, companies are well situated to fully leverage AI and reimagine business for the modern age.

Traditional technology architectures built around data silos, disparate systems, and disconnected workflows make it difficult for companies to capitalize on the AI opportunity. Enter agentic AI automation technologies, and now, intelligent agents, which are redefining how companies do business, including making the customer the epicenter of all interactions.

Increased investment in AI and AI agents is fueling worldwide spending on digital transformation, which is expected to grow at

a compound annual growth rate (CAGR) of 16.2% over the period of 2022 to 2027, soaring to nearly \$4 trillion in 2027, according to research from IDC.¹ While organizations are spending more, they are altering digital transformation priorities. Deloitte² found organizations investing in critical technologies including cloud, AI, and automation for more concrete business use cases like entering new markets, delivering new customer experiences, and modernizing core systems.

This transformation extends beyond customer demands for superior experiences. Employees seek solutions that streamline and automate repetitive tasks, enabling focus on higher-value, more meaningful work. Gartner projects that by 2024, AI will facilitate 70% of text- and data-heavy tasks, up from less than 10% in 2023. “The integration of AI into workflows will not only streamline operations but also foster innovation, leading to unprecedented productivity gains in the coming years,” according to Gartner’s Top Strategic Technology Trends for 2025.³

Organizations can achieve end-to-end visibility, enable seamless workflows, and maximize productivity only through a unified platform with a single architecture and data model. This empowers employees across departments to drive innovation without the burden of menial tasks, technical debt, or the need to rebuild existing IT infrastructure.

ServiceNow exemplifies this approach through its single data-model platform, integrating agentic AI directly within its core architecture. This integration grants AI agents access to vast organizational knowledge repositories—billions of data points and millions of automated processes across customer environments.

The benefits of this deep integration are immediate and practical. AI agents can instantly leverage an organization's collective knowledge base, taking meaningful actions

without extensive training periods. These intelligent agents transcend basic information processing—they understand business contexts and requirements, autonomously adapting their responses and actions to advance work.

Through its unified foundation—a single architecture, data model, and platform working in concert—this cohesive approach to agentic AI fundamentally transforms operations, delivering enhanced speed and intelligence across all business processes.

Challenges with Traditional Ways of Working

Companies face an array of challenges as they reposition for the modern business era.

O

utdated technology and manual processes make it difficult to manage projects and resources, creating inefficiencies and driving up costs.

Employees spend too much time on low-level, repetitive tasks or in fire-fighting mode to resolve problems. This takes a toll on productivity and reduces bandwidth for work that creates differentiated business value.

According to a [survey from Gartner](#), desk workers juggle an average of 11 applications compared to only six in 2019. Forty percent of those surveyed are using more than that average number, and 5% use 26 or more applications in their typical work routines. The impact of application sprawl is significant: Nearly half (47%) of digital workers surveyed said they struggle to find

the information needed to effectively perform their jobs, and 32% said they made the wrong decision due to lack of awareness.

Workflows based on siloed apps and data create multiple pain points and bottlenecks across the organization. Here are a few examples:

- **Customer service and operations:** Delivering great customer experiences while reducing costs is the North Star. Yet data and application silos across front, middle, and back office systems and teams stand in the way of delivering a unified customer journey and empowering agents with real-time information and intelligence.
- **IT:** Technology leaders must uplevel employee and customer experiences through expansive use of technology while keeping costs in check. They are modernizing applications with cloud transformation, automating application delivery, and reinforcing security postures to minimize risk. Without a unified platform, IT organizations have difficulty managing assets and aligning teams around a common strategy. Rework is an issue as is optimization of cloud spend. IT teams also struggle to cost-effectively and safely scale application development while spending too much time on manual and repetitive workflows, including those related to system integration.
- **HR:** High on HR's agenda is making it easier for employees to find answers through self-service requests across any number of enterprise workflows. HR also needs more efficient ways to identify workforce skills gaps and make intelligent hiring decisions. Talent development is a big area of focus in light of critical skills gaps, particularly around AI.
- **Finance and supply chain:** Amid uncertain economic times, financial and supply chain leaders must improve spend and procurement productivity. This includes reducing the time and effort to onboard suppliers. Holistic visibility and streamlined workflows are crucial to managing third-party and supplier risk and to improving sustainability and ESG practices, including responsible sourcing.
- **Workplace services:** As many employees have returned to the office in the post-pandemic period, organizations need data and insights to make informed decisions on real estate strategies and spend, planning and space utilization, and delivering modern workplace experiences.
- **Risk & compliance:** In light of new and evolving regulations and the need for business continuity and operational resiliency, risk and compliance are top C-level concerns. Organizations need a more effective means of managing and reporting on enterprise-wide risks and compliance.

The rapidly evolving AI landscape presents a myriad of opportunities to address these challenges. According to the McKenzie Global Institute, AI, automation and reskilling are essential to the effort to reignite productivity in the United States. With AI, [McKenzie research](#) estimates that by 2030 AI could take over tasks accounting for 30% of hours worked in the US.

C-suite leaders are bullish on the overall value of AI and AI agents. In an [IDC survey](#), three-quarters of CEOs said AI presents a “massive” or “significant” opportunity to drive differentiation and new growth in 2024 and beyond,⁴ and 81% percent of global organizations plan to increase AI spend next year.⁵ On average, companies expect to channel 16% of new project budgets to AI in 2024, IDC reports.

Despite the possibilities, cost, skills, and deployment issues threaten to hamper AI’s impact. Workers need to learn new skills, and there are concerns about data and intellectual property controls. [IDC research](#)⁶ revealed 60% of CEOs confirm their organizations lack the skills within business functions to execute on AI initiatives. There are also excessive costs associated with AI-enhanced apps, and the infrastructure associated with model training and running those apps.⁷

The Now Platform: *Empowering transformation*

Change is at your fingertips.

An enterprise-wide platform that supports a seamlessly innovative AI strategy can help maximize the business value of AI, enabling organizations to achieve optimal impact on productivity, experience, and revenue growth. IDC research found organizations are gravitating to a platform approach to:

- Improve customer engagement and experiences (39%)
- Increase business agility (39%)
- Prepare for new technical capabilities (36%)
- Enhance security (35%)
- Automate business processes (33%).⁸

Infusing coordinated AI capabilities and a workflow data fabric throughout an

organization helps to automate and optimize work across the spectrum of enterprise functions.

“Agentic AI without unification creates more complexity within an enterprise. The ability of ServiceNow AI Agents to work together on tasks that draw from multiple systems and

departments truly stands out,” said Amit Zavery, president, chief product officer and chief operating officer at ServiceNow. “With a single location to orchestrate agents and prevent sprawl, our ServiceNow AI Agents collaborate like active participants at work, acting as true extensions of their human counterparts.”

⁸ IDC InfoBrief: Maximize AI Value with a Digital Platform IDC’s GenAI ARC Survey, <https://www.servicenow.com/standard/resource-center/analyst-report/ar-idc-infobrief-maximize-ai-with-digital-platform.html>

With the Now Platform, organizations can:

Strengthen a digital

foundation. Maximize the value of existing technology investments with a single, unified cloud platform. Fast-track digital initiatives through accelerated delivery of new capabilities with greater controls.

Boost employee productivity. Simple and intuitive employee experiences increase productivity and engagement. Employees are empowered to work smarter and faster through native, purpose-built AI capabilities and analytics. Teams are freed up to focus on higher-value work.

Create resilient and efficient

operations. Connect siloed systems, departments, and processes while automating best-in-class digital workflows.

Deliver seamless customer

experiences. Drive customer satisfaction and loyalty with unified web, mobile, and conversational experiences. Empower developers at any skill level to build apps fast with low-code tools.

Enhance governance and reduce risk.

The Now Platform's single data model eliminates information silos, delivering an integrated view of risk and compliance. AI-powered experiences accelerate everyday tasks, and workflow automation helps speed cross-functional response to risk and compliance violations.

Mitigate risk and reinforce

cybersecurity. Data protection, encryption, and identity & access management capabilities ensure the right users have access to relevant technology resources.

The Now Platform: AI at its core

- **Orchestrating the Future: ServiceNow's AI Agent Command Center**

As AI rapidly evolves, orchestration has emerged as the critical differentiator between basic automation and truly transformative business operations. At the forefront of this evolution, the ServiceNow Platform stands as a sophisticated command center—an intelligent nexus that connects and coordinates AI activities across every facet of the enterprise.

At the heart of this innovation lies the ServiceNow AI Agent Orchestrator, a groundbreaking system that elevates organizational operations to unprecedented levels of efficiency. Think of it as a master conductor, transforming individual AI agents from solo performers into a harmonious orchestra, all working in concert toward shared organizational objectives.

This represents a quantum leap beyond traditional AI implementations. While conventional AI agents operate in isolation, confined to simple conversational tasks and limited workflows, the ServiceNow AI Agent Orchestrator introduces a new paradigm of collaborative intelligence. Through sophisticated inter-agent communication protocols and centralized coordination, it enables seamless information sharing and task handoffs across the entire enterprise ecosystem.

The true power of this orchestration becomes evident in complex, multistep workflows. Whether a process begins in customer service, finance, or operations, the ServiceNow AI Agent Orchestrator ensures that AI agents can efficiently collaborate, share context, and transition tasks smoothly, making them invaluable partners in managing even the most intricate business processes.

- **Scaling Intelligence: The ServiceNow AI Agent Advantage**

With thousands of AI Agents already active across the platform and new ones being deployed daily, ServiceNow has created an unparalleled ecosystem of intelligent automation. These agents power millions of business processes annually, supporting ServiceNow customers across every sector and function.

- **The Power of Two Decades of Enterprise Intelligence**

What truly sets ServiceNow AI Agents apart in the marketplace is their foundation: 20 years of rich automation data and proven outcomes from addressing the most challenging enterprise workflow scenarios. Unlike agents constrained by single-cloud architectures or limited data repositories, ServiceNow AI Agents draw upon a vast reservoir of enterprise intelligence—often across every aspect of an entire business.

This deep well of structured and unstructured data enables something extraordinary: AI agents that deliver value from their very first deployment. Each agent builds upon ServiceNow's extensive experience in automating complex business processes, bringing sophisticated capabilities informed by real-world implementations and outcomes.

- **The Next Wave of Enterprise Intelligence**

ServiceNow's latest AI Agent rollout marks a significant milestone in enterprise automation. This expansion introduces thousands of pre-trained AI Agents specifically designed for key business functions—IT operations, customer service, human resources, and beyond. These specialized agents don't just participate in business processes; they actively drive them forward, achieving unprecedented levels of speed and efficiency in critical workflow automation.

The Now Platform:

A breakdown of key solutions

With its single data model and extensible scalable architecture, the Now Platform offers a flexible approach for working smarter across the enterprise, regardless of function and industry focus. With out-of-the-box digital workflows, integrated AI, and a full portfolio of domain-specific modules, the Now Platform empowers organizations to maximize the value of existing technology investments, fast-track digital initiatives, and deliver modern consumer-like experiences at scale.

AI and AI Agents

T

he **Now Assist** products infuse out-of-the-box AI capabilities across the Now Platform. The combination empowers workflows and

experiences that amplify productivity across all areas of the business. Domain-specific models improve productivity and efficiency, elevate self-service, deliver custom recommended actions and answers, and ensure search becomes a more effective tool.

Now Assist directed HR use cases lets workers self-service answers to common onboarding or benefits questions on their mobile device. This ensures faster resolution for simple troubleshooting. In a customer service example, Now Assist can create summaries for cases, chats, and incidents with chatbots and virtual agents deployed for powerful and personalized self-service workflows. HR, marketing, and other departments can tap Now Assist to create and edit written content, from emails to chat replies. Within IT, Now Assist helps teams triage and interpret alerts for streamlined

operations management, provides context and advanced search for self-service problem resolution, and jumpstarts the design of apps and service catalog capabilities.

ServiceNow is expanding Now Assist with specific-industry focus, delivering AI assistants tuned to the needs of the telecom, media, technology, financial services, and public sectors. In financial services, for example, ServiceNow has partnered with Visa, Inc. to create **ServiceNow Disputes Management**, an AI-powered workflow integrated with networks that helps banks automate and orchestrate disputes with a single experience layer. The AI layer synthesizes case information, delivers chatbots for rapid customer intake and support, and delivers intelligent request routing to optimize operational efficiency.

Public Sector Digital Services with Now Assist helps government agencies and functions deliver improved experiences to meet customers where they are, on mobile devices, phones, or kiosks.

Telecommunications Service Management with Now Assist delivers a single AI platform enabling telcos to deliver smarter self-service solutions for customers, boost agent productivity for faster problem resolution, and accelerate diagnostics and solving network performance issues.

IT Service Management (ITSM) Pro

T

he need for highly resilient IT services, coupled with ongoing requirements related to hybrid work environments, is challenging

IT service organizations to up their game. Building on the **ServiceNow ITSM and the Now Platform** foundation, IT teams can access additional capabilities that enhance and accelerate service delivery to ensure greater employee productivity and satisfaction.

ServiceNow ITSM Pro adds eight additional applications to the base ITSM platform, including predictive intelligence, virtual agents, performance analytics, and DevOps change management features. The expanded mix helps IT organizations deliver unrivaled 24/7 service that can easily scale via automation, continuous improvement, and self-service.

With AI-infused capabilities like predictive intelligence, ITSM Pro automatically categorizes, routes, and assigns IT tickets and makes resolution recommendations,

eliminating routing delays and lessening backlog creep so customers have a cohesive, rewarding experience. Anyone capable of creating reports in the Now Platform can create machine learning models without assistance from data science experts. With Virtual Agents, an AI chatbot solution, customers can resolve common requests using a natural language experience that eliminates the need for human agents.

A [nationally recognized university health](#)

[system and school of medicine](#) leveraged ITSM Pro's Virtual Agent and Performance Analytics functions to reinvent the employee experience, better service patients and students, and reduce time-to-resolution for problem solving. Not only was the health system able to fast-track tickets, it updated and serviced 11% of customers during a critical incident, streamlining overall operations.

Customer Service Management (CSM)

A

I-powered self-service sets up agents for success with real-time information that can boost their productivity and meet the soaring demands of today's discerning customers. Harnessing the power of the Now Platform and AI Agents, CSM unites service and customer operations with one internal and external service tool to track service KPIs such as response times and first contact resolution.

With the solution, organizations can optimize omnichannel self-service and AI-driven issue resolution, automate customer operations processes across departments, and empower agents with real-time intelligence for improved decision-making. **Performance Analytics** capabilities unlock insights to help anticipate trends, prioritize issues, and drive overall service improvements.

Other features for enhancing agent performance include case and chat summarization for synthesizing customer interactions and complex cases, workforce

optimization, guided decisions supported by contextual next-best action recommendations, and automatic routing of work to the best agent based on specific criteria.

In one example, a manufacturing customer achieved a number of benefits with the Now Platform and CSM, including a **23% reduction in mean time to resolution** and a **\$4.9 million savings** from more efficient cost handling.

HR Service Delivery

S

erviceNow's Human Resources Service Delivery (HRSD) Solution makes it easier to deliver a unified employee service experience for all

HR requests. Employees no longer have to navigate through a maze of siloed systems to find answers to common HR questions or to access HR and benefits resources.

The Now Platform establishes a point of access for multi-department service delivery and serves up timely, relevant information and announcements through AI-driven content recommendations. Employees can easily complete tasks, request help, and interact with virtual agents. There are optimization tools to drill down in HR agent schedules, workloads, and skills to take aim at operational efficiency.

App Engine

IT organizations are often pushed to their max with service requests for apps that will digitize and automate all corners of the business. With App Engine, IT can reduce the growing application backlog and shadow IT usage through low-code development tools.

App Engine delivers proven, out-of-the-box capabilities, built-in collaboration tools, and role-based access that empowers citizen developers to build their own apps within a governance framework. IT still has oversight of what's being developed, but the low-code capabilities facilitate up to 4x faster app development, promoting agility, according to ServiceNow.

App Engine eliminates much of the complexity of traditional app development while reducing application sprawl and technical debt. As part of the Now Platform, users can easily access core capabilities including self-service, mobile, chatbots, analytics, and machine learning.

5 steps to determine platform choice

1. Calculate cost savings from consolidation

2. Identify innovation potential and productivity gains

3. Determine implementation staffing needs, including whether citizen development can work

4. Ensure AI is contained to trusted systems and is governed by embedded security

5. Correlate potential revenue gains to enhanced productivity and improved customer outcomes

Source: IDC InfoBrief: Maximizing the Business Value of AI with a Digital Platform

- **AI Agent Studio:
Democratizing Enterprise AI
Development**

The introduction of ServiceNow AI Agent Studio marks a transformative moment in enterprise automation—one that puts the power of agentic AI directly into the hands of every business user. ServiceNow's AI Agent Studio demolishes the traditional barriers between innovative ideas and their implementation, enabling organizations to create and deploy custom AI agents without writing a single line of code.

- **Natural Language:
The New Programming Language**

Gone are the days of complex coding requirements and technical barriers. AI Agent Studio introduces an intuitive, language-based interface that speaks your business language. Users simply express their desired outcomes, define agent roles, and describe their ideal processes using natural language prompts. The platform transforms these

plain-English instructions into sophisticated teams of AI Agents, orchestrated and ready for immediate deployment.

- **From Concept to Implementation:
A Guided Journey**

The platform provides a structured yet flexible pathway through the entire agent development lifecycle. Users are guided through each critical phase:

- Creating agents tailored to specific business needs
- Testing capabilities in a controlled environment
- Activating agents for real-world deployment

- **Seamless Integration with Existing
Automation**

What sets AI Agent Studio apart is its deep integration with ServiceNow's extensive automation ecosystem. By connecting seamlessly with existing skills, flows, and

processes on the ServiceNow Platform, organizations can leverage their current automation investments while extending capabilities through custom AI Agents. This integration ensures that new agents work harmoniously with established workflows, enhancing rather than disrupting existing business processes.

The result is a platform that doesn't just simplify AI Agent creation—it fundamentally transforms how organizations approach process automation, making sophisticated AI capabilities accessible to every business user while maintaining enterprise-grade reliability and control.

Why Us?

Reseller and implementation partners are crucial to Now Platform deployment success and for making good on **AI-powered business transformation**. We are a valued partner of ServiceNow with extensive expertise and experience.
